YouTube Music Videos as a Library to Millumin Mapped on a Copy Paper Box

Presentations 4 and 5 were created utilizing music videos found on YouTube. The videos were then imported into the software Millumin's Library. For the first presentation #4, I used a typical layering method to wrap each side of the box, however I did not want an exact copy so I mirrored one side and zoomed into a specific area on the top so that the entire mapping was cohesive but unique as a whole. For the second presentation #5, I experimented with the Millumin's composition feature, which gave more control to the alignment of the music and control for starting and stopping the visual effects.

After Effects Plugin to Millumin Mapped on Boxes

Presentation #6 came from a file provided by Millumin to help learn the software by using a link to Adobe's After Effects. The power of Millumin is greatly enhanced with this feature. Graphics and animations can be made on the fly while Millumin is controlling the simple effects of timing and transitions. You can also use the many features in AfterEffects too. Therefore when the AfterEffects Video is in RAM Preview or normal play mode, Millumin uses a Syphon like plugin to capture the video and to import it into it's software.
